

## A • Misspelling<sub>4</sub>

Misspelling is an art form that students seem to excel at. Write a program that removes the  $n$ th character from an input string.

### Input

The first line of input contains a single integer  $N$ , ( $1 \leq N \leq 1000$ ) which is the number of datasets that follow.

Each dataset consists of a single line of input containing  $M$ , a space, and a single word made up of uppercase letters only.  $M$  will be less than or equal to the length of the word. The length of the word is guaranteed to be less than or equal to 80.

### Output

For each dataset, you should generate one line of output with the following values: The dataset number as a decimal integer (start counting at one), a space, and the misspelled word. The misspelled word is the input word with the indicated character deleted.

Sample Input	Sample Output
4	1 MISPELL
4 MISSPELL	2 ROGRAMMING
1 PROGRAMMING	3 CONTES
7 CONTEST	4 BALOON
3 BALLOON
