## G • Simple Collatz Sequence

The Simple Collatz Sequence (SCS) starting at an integer $\boldsymbol{n}$, is defined by the formula:

$$
S(k)=(k / 2 \text { if } k \text { is even, else }(k+1))
$$

The sequence is then $\boldsymbol{n}, \mathrm{S}(\boldsymbol{n}), \mathrm{S}(\mathrm{S}(\boldsymbol{n})), \quad$... until the value first reaches 1 .
For example, starting at 11 , we have:

$$
11 \text {-> } 12 \text {-> } 6 \text {-> } 3 \text {-> } 4 \text {-> } 2 \text {->1 }
$$

The sequence always ends at 1. (Fun Fact: The Hard Collatz Sequence sends odd k to $3 * k+1$. It is unknown whether that sequence always ends at 1.)

Let $\mathrm{A}(\boldsymbol{n})=$ number of steps in the SCS starting at $\boldsymbol{n}$. For example, $\mathrm{A}(11)=6$. Write a program which computes $\mathrm{A}(\boldsymbol{n})$ for a given input $\boldsymbol{n}$.

## Input

Input consists of a single line which contains a positive decimal integer, $\boldsymbol{n}$, which starts the sequence. $n$ will fit in a 32 -bit unsigned integer.

## Output

The output consists of a single line that contains the value of A $(\mathrm{n})$, the number of steps in the SCS starting at $n$.

Sample 1:

| Sample Input | Sample Output |
| :--- | :--- |
| 11 | 6 |

Sample 2:

| Sample Input | Sample Output |
| :--- | :--- |
| 123456789 | 39 |
