## $\mathrm{J} \bullet$ How Many Unicycles in a Wheel?

A Wheel Graph of size $\boldsymbol{n}$ is a cycle of $\boldsymbol{n}$ vertices each of which is connected to a center vertex. Examples of wheel graphs of size 4,5,6 and 8 are shown below:

6

A spanning unicycle in a graph, $\mathbf{G}$, is a spanning tree in $\mathbf{G}$ with one additional edge added to form a single cycle. Each of the examples below is a spanning unicycle in a wheel graph of size 5:

Write a program to compute the number of different unicycles in a wheel graph of size $\boldsymbol{n}$. Recall that two subgraphs, $\mathbf{S 1}$ and $\mathbf{S 2}$, of a graph $\mathbf{G}$ are different if there is at least one edge of $\mathbf{G}$ that is in $\mathbf{S 1}$ and not in S2 OR an edge in S2 which is not in $\mathbf{S 1}$.

## Input

Input consists of a single line that contains a decimal integer, $\boldsymbol{m}$ ( $3<=\boldsymbol{m}<=4000$ ), which is the size of the wheel graph to find the number of unicycles of.

## Output

The single output line consists of the count of unicycles modulo 100007 for the input size $\boldsymbol{m}$.
Sample 1:

| Sample Input | Sample Output |
| :--- | :--- |
| 5 | 170 |

Sample 2:

| Sample Input | Sample Output |
| :--- | :--- |
| 1234 | 17511 |
