## J•Cardinal Adjacencies

In landscape ecology, one is interested in the connectedness of regions, particularly near shorelines. A fine grid is overlaid on a map or aerial photo and grid squares with land are marked:

Land squares which share an edge are cardinal (North, East, South and West) adjacent (blue lines in the image) and land squares which share an edge or a vertex (red and blue lines in the image) are intercardinal adjacent. Write a program which takes as input a marked grid and outputs the total cardinal adjacencies in the grid and the total number of intercardinal adjacencies in the grid.

## Input

The input consists of multiple lines. The first line of input contains two space separated decimal integers nrows and ncolumns, ( $0<$ nrows, ncolumns $\leq 1000$ ). This line is followed by nrows additional lines of input each of which contains mcolumns space separated values of 0 or 1 . 1 indicates land.

## Output

There is one line of output containing two space separated decimal integers: the number of cardinal adjacencies followed by the number of intercardinal adjacencies.

## Sample 1:

| Sample Input |  |  |  | Sample Output |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 5 | 5 |  | 14 | 31 |  |
| 1 | 0 | 0 | 1 | 0 |  |
| 0 | 1 | 1 | 0 | 1 |  |
| 0 | 1 | 0 | 1 | 1 |  |
| 1 | 0 | 1 | 1 | 1 |  |
| 0 | 1 | 1 | 1 | 1 |  |
